FOR IMMEDIATE RELEASE

Centura Health Implements MobileMD™ Health Information Exchange For Outsourced Clinical Data Sharing

Englewood, Colo. (March 28, 2006)

MobileMD™, a leading provider of health information technology, today announced it has successfully implemented its MobileMD™ Health Information Exchange (HIE) at Centura Health, Colorado's largest health care system and one of the state's largest private employers.

The MobileMD™ HIE is an outsourced service that receives clinical information such as lab results, transcription and radiology reports from all 12 Centura Hospitals. MobileMD™ HIE then provides "real time" transmission, interfacing hospital data into the electronic medical record (EMR) systems of the appropriate subscribing Centura physicians.

"Meeting our private physician requests for electronic feeds for their EMR systems was and is a high priority for Centura Health. The outsourced MobileMD™ Solution has allowed us to concentrate on our other strategic IT projects, while simultaneously meeting the private physician practice connectivity needs", said Amy Feaster, Centura's vice president of Information Technology.

"Our private physician practice community relies on patient health information from our Centura facilities and we needed an innovative and secure means by which patient information can be communicated electronically in a manner that improves the speed and safety of patient care," said Dr. Michael Shrift, Centura's chief medical information officer."

Many specialties, such as internal medicine, orthopedics and neurosurgery, receive as much as 50 percent of their patients' health information from hospitals with which they are affiliated. By receiving that information electronically, directly into the physician practice EMR system, practice-operating costs are decreased, human error rates are decreased and communication speed is dramatically improved. In the past, when a patient received treatment and testing at the hospital, the doctor's clinical staff had to obtain the reports and results individually from the health system's portal, or wait until the information was received via fax or mail. As a result, patient communications suffered, and critical patient information was often lost. With MobileMD™, HIE physicians and staff have access to appropriate health system information, within their private practice EMR, in "real time".

"The benefit to patient care is enormous," said MobileMD™, subscriber Dr. Michael Mignoli of SouthPark Internal Medicine, Highlands Ranch, Colo. "The level of accuracy, plus the speed with which the information is made electronically available in my EMR, has far exceeded my expectations."

Mignoli said if one of his patients is treated in an emergency department overnight, he has the information in the morning. In the past, the patient would often have called and alerted him about their emergency treatment.

"MobileMD™ HIE provides a scalable, practical answer to the interconnectivity needs of regional health systems," said John Skinner, president of MobileMD™. "As a result, we are very excited about the positive impact our product is having on regional health care. Centura is an excellent business partner and serves as our case in point."

About Centura Health

Colorado's largest health care provider, the Centura Health family includes 12 hospitals, eight senior living residences, medical clinics, Flight For Life Colorado and home care and hospice services. A nonprofit, faith-based organization, Centura Health is a joint venture organization that was formed in 1996 by Catholic Health Initiatives Colorado and Adventist Health System. Centura Health provides care and comfort to more than half a million people each year and is Colorado's fourth largest private employer with more than 12,000 associates.
